

React Native (Expo) Machine Test – Scheme Details Screen

Objective

Implement the Scheme Details Screen as per the shared Figma design. The test evaluates UI accuracy, component structure, JSON data mapping, i18n handling, graph implementation using Skia, and overall architecture.

Technical Stack (Mandatory)

- React Native (Expo – latest stable SDK)
- TypeScript
- @shopify/react-native-skia (for graph rendering)
- Functional Components + Hooks
- Proper folder structure

Design Implementation

- Implement the UI exactly as per shared Figma.
- Maintain spacing, typography, and layout hierarchy.
- Follow reusable component architecture.
- Ensure responsiveness across device sizes.

Accordion Behavior

- All major sections must behave as accordions.
- Initially, all sections should be collapsed.
- On click, section expands smoothly.
- Optional: Allow multiple sections open simultaneously.

JSON Data Mapping

- Store provided JSON locally as dummy data.
- Map all UI fields dynamically from JSON.
- Do NOT hardcode values.
- Handle missing or empty values gracefully.

i18n Implementation (Mandatory)

- Create separate i18n JSON files (e.g., /locales/en.json).
- Store all labels including section headers, field labels, buttons, graph titles, graph descriptions, and static text.
- Do not hardcode any visible labels inside components.

Graph Implementation (Skia)

- Use @shopify/react-native-skia.
- Implement NAV line graph using nav_json data.
- Smooth curve rendering and proper scaling.
- Handle large datasets efficiently.
- Optional: Gradient fill below graph.

Return Analysis Section

- Toggle between SIP Returns & Lumpsum Returns.
- Render data dynamically using provided arrays.

Return Calculator

- Toggle between Monthly SIP and One Time.
- Input field for amount.
- Calculate dummy projection (assume fixed return %).
- Display total invested and estimated value.

Riskometer

- Display dynamic risk level from riskometer_value.
- Highlight current risk (e.g., Very High).

Folder Structure (Suggested)

```
/src  
/components  
/screens  
/hooks  
/utils
```

/constants
/locales
/data

Submission Guidelines

- Share GitHub repository link.
- Provide Expo build link (if possible).
- Include README with setup steps, architecture explanation, assumptions made, and time taken.

Evaluation Criteria

- UI accuracy vs Figma
- Clean architecture
- Proper JSON mapping
- Proper i18n usage
- Graph implementation quality
- Code readability & reusability
- Error handling & performance
